

Bird-safe glass – AviSafe

- ✓ coating that reduces the risk of bird collisions with glass barriers
- ✓ active coating is on the first exterior pane of glass
- ✓ disruption of reflections of the sky and plants (factors that disorient birds)
- ✓ enhancement of UV reflections that are invisible to the human eye
- ✓ maximum size: 5000 x 2700 mm

AviSafe reduces the number of birds' collisions with glass barriers.

AviSafe uses a special coating that enhances the reflection of UV rays, allowing birds to notice obstacles earlier and avoid them. The reflection of light waves invisible to the human eye helps achieve the desired results without negatively affecting the building's aesthetics.

AviSafe glass, unlike many similar solutions on the market, has a UV-reflective coating on the surface of the first external pane, which further blurs reflections of the sky and plants – elements that increase the risk of collisions.
