

# Decorative Glass

- ✓ sandblasted glass available from the thickness of 6mm
- ✓ colored glass ESG available in a wide range of RAL
- ✓ colored glass VSG, depending on the color, can be used inside or outside
- ✓ ornamental glass is a semi-transparent or white semi-matte glass with a thickness of 4 mm (except for Niagara glass, which has a thickness of 5 mm)

**Decorative glass is an excellent choice for windows, doors and partition walls. Depending on the selected type or pattern, it can not only increase privacy, but also brighten the interior, making it optically more spacious, which is another advantage.**

In addition to standard matt acid-etched glass, we also offer glass in a wide range of colors, as well as ornamental glass available in many designs.

**Matt glass** is available in 3 versions. Achieving the effect of a matte glass is possible with the use of matte PVB mat foil (in VSG panes), thanks to the technology of etching one of the surfaces with acid (Satinovo) and by sandblasting. Each of the available versions has a different shade and use.

By using the sandblasting technology, on translucent or colored glass, it is also possible to make a pattern created by the customer or to choose one of the ready-made EkoVitres panels range.

**VSG colored glass** – provides architects and designers with complete freedom of creation. We offer transparent, translucent or non-transparent color options of various intensity. In addition to the acclaimed color technology, all layers provide the traditional benefits of laminated glass. All color intermediates are made of heat and light resistant pigments to resist fading.

**Colored ESG glass** – is an opaque glass, the color of which is obtained by applying a layer of enamel to one of the sides of the glass pane.

Toughened glass marked as **emalit/seralit** is available in a wide range of RAL colors. There is a possibility of joining glass, laminating, cutting holes and shapes. It is also possible to make patterns by screen printing covered with mineral enamel.

A ready-made standard range of patterns is available, however, on a special request, it is also possible to make individual patterns developed for a specific project.

Enameled glass does not create a perfect coating. This means that with the suitable light and without a full barrier directly behind the glass, streaks and translucent spots may be visible.

**Ornamental glass** – translucent colorless glass or white frosted glass. It provides a wide range of design possibilities and allows you to fully personalize your space. Depending on the pattern, the transparency of the glass is smaller or larger, which provides better privacy control while brightening the space. This feature is determined by the transparency control coefficient.
