

Slide Glass

✓ glazing: 10 mm tempered glass

✓ system designed for interiors

The Slide Glass aluminium sliding system is designed for modern interiors where users expect ergonomics, good lighting and an effective arrangement. It also works well as a way of building pergolas, offering effective protection against the wind.

The visibility of the profiles has been minimised in the system and the size of the glazing has been clearly improved compared to traditional solutions. **Slide Glass uses 10 mm safety tempered glass.** It is also possible to close its sashes using built-in side hooks or special locks.

Thanks to Slide Glass, you can create complex labyrinth systems dividing the space into independent zones. In this case, the connection of elements can be made in a non-profile approach (without sealing) or with the use of a narrow brush profile.
