The Reynaers SlimLine 38 system has been developed for modern architecture focused on sprawling glazing. It is also ideal for use in the renovation projects of industrial buildings. It allows them to retain the traditional style of steel windows.

The system's versatility is ensured by the availability of three aesthetic variants of profiles: Classic, Ferro and Cubic. The possibility of almost any mixture of frames, sashes and girders between variants makes it easy to adapt the ideal configuration.

*The above value of Uw is given for a reference window with dimensions of 1230 x 1480 mm, in the best thermal variant.
