The Smart Slide NEO sliding system is an attractive alternative for classic solutions of the PSK/Patio type. Being based on simple and proven solutions makes it an interesting offer, which means that its use is not a challenge neither for the installer nor the user.

The ease of use and reliability in Smart Slide Neo systems is presented in a very aesthetic way. **Visually light, minimalistic profile refers to the Scandinavian style, and their untypical shape for uPVC windows offers a better interior sun exposure and makes it a perfect solution for modern designs. The perfect weld and a wide range of available colours (including wood-like veneers)** will astonish everyone who loves beautiful interior designs. In small apartments, the sliding system will provide more living space, and when there is more living space, you are able to utilise the full potential of the impressive dimensions of the system.

Smart Slide NEO is distinguished by its technical parameters. **Low U value, caused by the additional gasket pressure** on the whole perimeter of the active sash, allows the application of the system everywhere where low heating bills are a top priority.
