

# Triple Pane Glazing Unit

- ✓ three glass panes connected by spacers – two of them are covered with a low-emission coating
- ✓ an aluminum spacer that is the basic element of the combination
- ✓ the inter-pane space is normally filled with 90% argon and 10% air
- ✓ it is possible to obtain a heat transfer coefficient up to  $U_g = 0,4 \text{ W/m}^2\text{K}$
- ✓ it is possible to create packages with different widths of components in the combination
- ✓ SWISSPACER Ultimate spacers available
- ✓ recommended for energy-saving construction due to a significant reduction in the heat transfer coefficient
- ✓ it is possible to fill the inter-pane space with krypton in order to reduce the heat transfer coefficient

A triple glazing unit consisting of three glass panes. It is a standard for window and door systems with increased thermal properties.

The standard unit is 48mm thick, the components of which are 4mm (glass) - 18mm (spacer) - 4mm (glass) - 18mm (spacer) - 4mm (glass), forming the so-called 4/18/4/18/4 unit.

In the space between the panes, created by the spacer, there is mainly argon (90%), which additionally reduces the  $U_g$  heat transfer coefficient.
